

ABSTRACT OF THE DISCLOSURE

A remote video-on-demand digital monitoring system principally includes an image capture module, a server relay module and a video-on-demand module.

- 5 The image data of said image capture module are stored in the server relay module through a telecommunication network. Through the telecommunication network, customers can browse the monitored web pages of the video-on-demand module via a browser, and view or store the monitored image data at a desired time segment according to a video-on-demand or movies-on-demand mode.
